Airpods pro Responsive landing page

- The steps I made to make air pods page
    1. The first I searched on google "air pods pro page js"
    2. I get to 2 videos with links "https://www.youtube.com/watch?v=4OcAAj8aqS8", https://www.youtube.com/watch?v=wLUJ9VNzZXo
    3. After that I decided to make the image the image sequence first through link https://www.apple.com/105/media/us/airpods-pro/2019/1299e2f5_9206_4470_b28e_08307a42f19b/anim/sequence/large/01-hero-lightpass/0001.jpg"
    4. I searched for the text and sequence animation so I get 3 libraries such as "**Scroll magic**" and "**Tween max**" and "**animation GSAB**"
    5. I go through such a big problem in text animation but I solved it through documentation
    6. After that I realized that the last section that scroll vertical can't made with animation except if we made it with slider that scroll vertical so I made it with swiper animation
    7. I added some animation like fade in
    8. After I tested the landing page I so that the swiper slider is not the best thing so I searched for something called intersection JavaScript observer API this solute the text scrolling vertical and animated it
    9. This the video of the intersection observer "https://www.youtube.com/watch?v=T8EYosX4NOo"

- The problem I faced:

    1. I didn't get the last animation in the first section so I searched out of the box in the sliders
    2. I didn't change the topic because I saw that apple airpods was enough to introduce the task
    3. At first I made the video instead of image sequence but I realized that image was pretty good and it has an end to catch it
